ABSTRACT: Synthetic biopolymers have been synthesized form glycerol modified soybean oil polyurethane and cardanol based liquid amino dyes by the use of benzoyl peroxide (BPO) as initiator and ethylene glycol dimethacrylate (EGDM) as cross linker in different NCO/OH ratios with DPMDI and TDI. The polymer so produced has been characterised by different methods like FTIR, TGA, and DSC. The Synthetic Polymers so produce can be used in different industrial applications in place of petroleum based products.

Keywords: Cardanol, Soybean Oil, Polyurethane, Benzoyl Peroxide, Ethylene glycol di-methacrylate (EGDM), Diphenyl methane di-isocyanate (DPMDI), Toluene 2, 4 di-isocynate (TDI)

I. INTRODUCTION

The urgent need of today is to develop polymers that are bio-degradable and eco-friendly. As soybean oil is a vegetable oil abundant in supply and relatively low cost, it has become an alternative source to synthesis polyols. About 40% of standard petroleum polyols have now been replaced by soybean oil. The other compound cardanol obtained by vacuum distillation from cashew nut shell liquid (CNSL) is also an agricultural product and an excellent monomer for synthetic polymer. IPNs from renewable resources were introduced by Sperling and Co. [1-3]. A number of articles are published [4-8] in this field with monomers derived from cardanol with other oils like castor oil, lin seed oil etc. Soybean oil is a chemical mixture of glycerides and unsaturated fatty acids. These synthetic polymer can be used in different field like adhesives binders, paints, varnishes coatings of different articles etc. due to its higher thermal stability and mechanical strength. In this paper authors have synthesised the polymer and characterised it by FTIR [9, 10], TGA [12, 13], DSC [14].

II. Experimental Section

Materials:
- Refined soybean oil was obtained from market.
- Cardanol was obtained from fractional distillation of CNSL liquid, a by-product of cashew Industry of South India.
- NaOH, MEK, EGDM, NaN02, HCl, PbO etc. was obtained from M/S BDH Ltd. (INDIA).
- TDI, DPMDI, 3-amino benzoic acid and 4-amino benzoic acid from E merk (GERMANY).

All chemicals were used as received.

III. METHOD

1. Spectroscopic analysis- FTIR (Fourier transform infrared): FTIR spectra of the prepared IPNs samples have been recorded on FTIR Spectrophotometer by Thermo Electric Corporation, USA, and Model: Nicolet 670 FT-IR using KBr pallete in the wavelength range of 400cm⁻¹ to 4000cm⁻¹.

2. Thermal Analysis (DSC and TGA): DSC and TGA of all IPNs have been performed by use of a Universal V4.5A.TA instrument (Model SDT Q 600 V20.9 Build 20) at a heating rate of 10⁰C/minute.

3. Morphology study (SEM): Morphology of samples has been studied by JOEL scanning electron microscope (SEM) Model JSM 500. For this the fractured samples have been coated with a thin layer of gold- platinum alloy by sputtering to provide conductive surface.

4. Test for biodegradability: The environmental resistance of the IPNs samples was carried out using soil burial test.

IV. Experimental:-

i. Preparation of dye monomer: 6.85g of 4-amino benzoic acid was dissolved in 13mL of conc. HCl acid and 5mL of water was added to it. The solution was cooled 0⁰-5⁰C, and then a cold solution of sodium nitrite (4g in 20mL of water) was added to it slowly with stirring for 3-4
minutes. A cold solution of cardanol (15g in 45ml) of 10% NaOH solution was prepared. Then cold diazonium solution was added slowly to the alkaline cardanol solution with stirring. A brilliant reddish brown coloured semi liquid dye was formed. The dye was separated by a separating funnel. The same procedure is repeated for 3-amino benzoic acid.

ii. Preparation of Mixed Ester Polyol (MEP) from Soybean Oil (SO): Refined soybean oil (350mL) was heated at 250° C in an inert Nitrogen atmosphere taken in three naked flask fitted with a thermometer reflux condensers and a stirrer. At this temperature litherage (0.168g) and glycol (80mL) were added to the reaction mixture with constant stirring. The temperature was maintained at 250°C until one volume of reaction mixture gave a clear solution in same volume methanol. At this stage the contents were cooled to obtain MEP.

iii. Synthesis of Polyurethane (PU): 1 mole of MEP was added to 1.6 mole of TDI to maintain NCO/OH ratio at 1.6. The reaction was carried out at 45°C with continuous stirring for one hour until a viscous pale yellow colour PU is separated out. The same process was repeated with different NCO/OH ratio (1.2, 1.6, and 2.0) and with other di-isocyanate DPMDE PU's were produced.

iv. Synthesis of IPNs: The mixture of PU and diazotised cardanol (with different PU/monomer ratio i.e., (25:75, 35:65, 50:50) and solvent (MEK) were taken in small beaker. Then 5mL of 10% EGDM along with 20mg of Benzoyl peroxide (BPO) were added to each mixture. The total mixture was stirred for 15 minutes with magnetic stirrer in cold to obtain a homogenous solution. Then the temperature was raised to 75°C and stirred until a thick solution was formed. Then the viscous mass was poured into a petridish in hot condition and kept in an oven at 75°C for 24 hour.

The thin film thus obtained was cooled and removed from the petridish with a sharp blade and sent for characterisation to the Central Instrumentation Facility Pondicherry University, Puducherry, pin-605014.

Soybean oil (SO): Triglyceride of linolenic acid (7-10%), linoleic acid (51%) and oleic acid (23%)
V. Analysis of the Sample:

1. FTIR – The FTIR spectra of the IPNs 6, 10, 12, 14 and 24 are presented in figs 1-a to 1-e. The presence of component materials in the macromolecules was confirmed by the study of FT-IR spectra if the prepared samples.

FTIR Of IPN-6

The characteristic absorption of IPN-6 corresponding to IPN-6 to O-H stretching of >OH groups shifted to lower value by hydrogen bonding at ...
3671.1 cm\(^{-1}\) and 3607.6 cm\(^{-1}\). N-H stretching of \textgreater NH group at 3333.5 cm\(^{-1}\), C-H stretching (ss/as) of \textgreater CH\(_2\) and \textgreater CH\(_3\) groups at 2857.7 cm\(^{-1}\) and 2926.4 cm\(^{-1}\). N=\text{C} stretching of \textless N=\text{C}=\text{O} for the isocyanate terminating PU unit at 2314.8 cm\(^{-1}\), C-O stretching of urethane linkage at 1662.8 cm\(^{-1}\), N=N stretching of azo group at 1605.7 cm\(^{-1}\), C-O bending at 1164.2 cm\(^{-1}\), C=C stretching at 1531.2 cm\(^{-1}\), C-C stretching at 1453.1 cm\(^{-1}\), out of plane C-H bending at 708.6 cm\(^{-1}\), and out of plane C-C bending at 506.3 cm\(^{-1}\) were observed.

FTIR OF IPN-10

The characteristic absorption of IPN-10 corresponding -OH stretching of >OH groups shifted to lower value by hydrogen bonding at 3837.7 cm\(^{-1}\). N-H stretching of >NH group at 3441.2 cm\(^{-1}\), C-H stretching (ss/as) of >CH\(_2\) and > CH\(_3\) groups at 2855.4 cm\(^{-1}\) and 2924.7 cm\(^{-1}\), N=C=C stretching of =N=O group for the isocyanate terminating PU unit at 2334.8 cm\(^{-1}\), C-O stretching of urethane linkage at 1665.0 cm\(^{-1}\), N=N stretching of azo group at 1589.8 cm\(^{-1}\), C-O bending at 1055.2 cm\(^{-1}\), C=C stretching at 1390.3 cm\(^{-1}\), C-C stretching at 1342.8 cm\(^{-1}\), out of plane C-H bending at 723.3 cm\(^{-1}\), and out of plane C-C bending at 450.5 cm\(^{-1}\) were observed.

FTIR OF IPN-12

The characteristic absorption of IPN-12 corresponding -OH stretching of >OH groups shifted to lower value by hydrogen bonding at 3834.8 cm\(^{-1}\). N-H stretching of >NH group at 3402.4 cm\(^{-1}\), C-H stretching (ss/as) of >CH\(_2\) and > CH\(_3\) groups at 2926.5 cm\(^{-1}\) and 2857.2 cm\(^{-1}\), N=C=C stretching of =N=O group for the isocyanate terminating PU unit at 2374.3 cm\(^{-1}\), C-O stretching of urethane linkage at 1727.6 cm\(^{-1}\), N=N stretching of azo group at 1604.0 cm\(^{-1}\), N=N stretching of aromatic rings at 1542.4 cm\(^{-1}\), C-O bending at 1164.2 cm\(^{-1}\), C=C stretching at 1531.2 cm\(^{-1}\), C=C stretching of aromatic rings at 1232.2 cm\(^{-1}\), C-O stretching of ester at 1160.7 cm\(^{-1}\), out of plane C-H bending at 869.6 cm\(^{-1}\), and out of plane C-C bending at 713.8 cm\(^{-1}\) were observed.

FTIR OF IPN-14

The characteristic absorption of IPN-14 corresponding to N-H stretching of >NH group at 3456.9 cm\(^{-1}\), C-H stretching (ss/as) of >CH\(_2\) and > CH\(_3\) groups at 2925.4 cm\(^{-1}\) and 2856.5 cm\(^{-1}\). N=C=C stretching of =N=O group for the isocyanates at 2354.0 cm\(^{-1}\) and 2546.0 cm\(^{-1}\), C-O stretching of urethane linkage at 1691.5 cm\(^{-1}\), N=N stretching of azo group at 1596.3 cm\(^{-1}\), N=N stretching of aromatic rings at 1542.4 cm\(^{-1}\), C=C stretching at 1393.2 cm\(^{-1}\), C=C stretching of aromatic rings at 1244.8 cm\(^{-1}\), C-O stretching of ester at 1166.6 cm\(^{-1}\), out of plane C-H bending at 784.4 cm\(^{-1}\), and out of plane C-C bending of p-substituted benzene ring at 695.2 cm\(^{-1}\) and 543.1 cm\(^{-1}\) were observed.

FTIR OF IPN-24

The characteristic absorption of IPN-24 corresponding to -OH stretching of >OH groups shifted to lower value by hydrogen bonding at 3590.8 and 3452.4 cm\(^{-1}\). N-H stretching of >NH group at 3349.2 cm\(^{-1}\), C-H stretching (ss/as) of >CH\(_2\) and > CH\(_3\) groups at 2921.1 cm\(^{-1}\) and 2861.8 cm\(^{-1}\), N=C=C stretching of =N=O group for the isocyanates at 2771.5 cm\(^{-1}\), 2619.9 cm\(^{-1}\), 2365.4 cm\(^{-1}\), C-O stretching of urethane linkage at 1984.0 cm\(^{-1}\), -OH bending due to –COOH group at 1306.7 cm\(^{-1}\), -N=O stretching of azo group at 1605.5 cm\(^{-1}\), C-O bending at 1154.8 cm\(^{-1}\), C=C stretching of aromatic rings at 1399.7 cm\(^{-1}\), C=C stretching of aromatic rings at 1518.6 cm\(^{-1}\), C-O stretching of ester at 1160.7 cm\(^{-1}\), out of plane C-H bending at 811 cm\(^{-1}\), and out of plane C-C bending of p-substituted benzene ring at 634 cm\(^{-1}\) and 481 cm\(^{-1}\) were observed.

Findings

From the fig.1a to 1e correlation with the peak of the authentic compound helps to identify the structure of the polymer sample. Thus it is concluded that the polymer sample contains azo based compound which contain –COOH, –OH, –CH\(_2\), –CH\(_3\), –C-O=C stretching of –OH groups, urethane linkage and benzene rings.

The probable structure of IPN is as in Scheme 4.

VI. Thermogravimetric Analysis

Thermal stability of IPNs was determined by the use of Universal V\(_4\) 5ATA instrument at a rate of 10\(^{0}\)C/min from room temperature to 700\(^{0}\)C, again it is cooled from 700\(^{0}\)C to room temperature. The percentage of mass left with temperature was recorded as shown in figure 2a to 2e.

In this paper we have compared the thermal stability of different IPNs with varied NCO/OH ratio and different amino acid compounds.

Findings

IPN\(_{12,14}\) less stable than IPN 6, IPN 10, IPN 14, IPN 24 having 0.50/0.50 PU/CD ratio. IPN 14 is the most stable of the five IPNs. IPNs are stable upto 180\(^{0}\)C after which they decompose. In general it is observed that IPNs undergo degradation in three steps. In the first step, there is an initial weight loss which is attributed to the loss of moisture retained in the samples and elimination of smaller groups. In the second step, there is a gradual weight loss which is due to the decomposition of the urethane linkage and volatilization of low molecular weight products. In this step, the unreacted unsaturated parts (=bonds) get activated due to the presence of excess benzoyl peroxide in the macromolecules. So, in the IPN cross linking, which makes the system more rigid, occurs
and the new cross-links formed inside the macromolecules develop a strain in the macromolecular chain resulting the release of small groups outside the macromolecular structure. In the third step, it is seen that the major portion of the samples decompose because of the random scission of the cardanol backbone. In this step, the strained macromolecules suffer depolymerisation (unzipping) leading to segmental release of larger groups and leaving a charred residue as shown in Table 1 & 2.

Kinetics of IPNs is determined by Freeman Anderson method as per the following equation:
$$\Delta \log \left( -\frac{dw}{dt} \right) = n \Delta \log w - \frac{E_a}{2.303R} \Delta \left( \frac{1}{T} \right)$$

Where \(n\) = order of reaction
\(E_a\) = Activation Energy

These values are determined from the plot of \(\Delta \log \left( -\frac{dw}{dt} \right)\) vs \(\Delta \log w\). The slope gives us order of reaction \(n\) and intercept is related to activation energy \((E_a)\) which is given by 
\(E_a = -\frac{\text{Intercept} \times 2.303 \times R}{\Delta \left( \frac{1}{T} \right)}\)

(As shown in fig. 3a(i) to Fig 3e (ii) and table 5.

VII. D.S.C. (Differential scanning calorimetric analysis)

In this instrument heat capacity of a sample is measured as the function of differential heat flow rate between the sample and reference material. The instrument directly gives a recording of heat flow rate against temperature. Heat flow rate undergoes a change during transition. \(T_g\), \(T_c\) and \(T_m\) values can be computed from the table-3.

\(T_g\): Glass transition temperature
\(T_c\): Curie temperature or crystallization temperature
\(T_m\): The temperature at which change of state occurs
\(T_f\): The flow point
\(T_g = \frac{\text{Pre transition temperature + Post transition temperature}}{2}\)

Findings
IPN 24 has more \(T_g\), \(T_c\) and \(T_m\) value than IPN 14 because it contains more amount of PU and more crystalline.

VIII. Biodegradability:
The IPN samples synthesized were tested for environmental resistance by use of soil burial test. The samples were buried in soil for sixty days. The samples were removed from the soil once in fifteen days to access the changes in their weight loss, mechanical strength and surface damage if any as shown in Table 4.

Findings
From this observation (table-4) it is seen that these samples are not biodegradable, only a small amount of it decomposes with the bacteria and virus present in the soil which is very negligible but can be recycled.

IX. Conclusion
These synthetic biopolymers highly cross linked and thermally stable, hence can be used in place of petroleum based polymers and exhibit excellent performance in various applications than the copolymers derived from simple cardanol.

X. ACKNOWLEDGEMENT

The authors are thankful to the Registrar, Ravenshaw University, Odisha for his kind permission to provide the laboratory facility and help to publish this paper. The authors are thankful to the Registrar, Utkal University, Bhubaneswar to publish the paper. The authors are also thankful to the Dean, Pondicherry University, Puducherry for characterisation of the samples.
