#### ABSTRACT

The FLAT slab system of construction is one in which the beam is used in the conventional methods of construction done away with the directly rests on column and the load from the slabs is directly transferred to the columns and then to the foundation. Drops or columns are generally provided with column heads or capitals. Grid floor systems consisting of beams spaced at regular intervals in perpendicular directions, monolithic with slab. They are generally employed for architectural reasons for large rooms such as auditoriums, vestibules, theatre halls, show rooms of shops where column free space is often the main requirement.

The aim of the project is to determine the most economical slab between flat slab with drop, Flat slab without drop and grid slab. The proposed construction site is Nexus point apposite to Vidhan Bhavan and beside NMC office, Nagpur. The total length of slab is 31.38 m and width is 27.22 m. total area of slab is 854.16 sqm. It is designed by using  $M_{35}$  Grade concrete and Fe<sub>415</sub> steel. Analysis of the flat slab and grid slab has been done both manually by IS 456-2000 and by using software also. Flat slab and Grid slab has been analyzed by STAAD PRO. Rates have been taken according to N.M.C. C.S.R

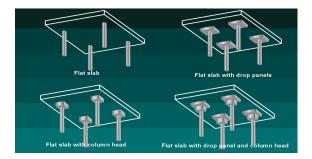

It is observed that the FLAT slab with drop is more economical than Flat slab without drop and Grid slabs.

### I. INTRODUCTION

#### 1.1 FLAT SLAB

A reinforced concrete flat slab, also called as beamless slab, is a slab supported directly by columns without beams. A part of the slab bounded on each of the four sides by centre line of column is called panel. The flat slab is often thickened closed to supporting columns to provide adequate strength in shear and to reduce the amount of negative reinforcement in the support regions. The thickened portion i.e. the projection below the slab is called drop or drop panel. In some cases, the section of column at top, as it

meets the floor slab or a drop panel, is enlarged so as to increase primarily the perimeter of the critical section, for shear and hence, increasing the capacity of the slab for resisting two-way shear and to reduce negative bending moment at the support. Such enlarged or flared portion of and a capital. Slabs of constant thickness which do not have drop panels or column capitals are referred to as flat plates. The strength of the flat plate structure is often limited due to punching shear action around columns, and consequently they are used for light loads and relatively small spans.

#### METHODS

#### DESIGN OF FLAT SLAB

#### Methods of Design:

Two approximate method methods are adopted by the codesfor the design of flat slab or flat plate .These method can beused provided the limitations specified therein are satisfied.Thetwodesignmethodsare:(a)Thedirectdesignmethod(b)The equivalent frame method

#### 1.2 GRID SLAB

Grid floor systems consisting of beams spaced at regular intervals in perpendicular directions, monolithic with slab.

| Item                           | X                 | Y     |
|--------------------------------|-------------------|-------|
| c to c span                    | 10.6              | 8.86  |
| Clear span(L <sub>n</sub> )    | 10.6-1.772= 8.828 | 7.088 |
| Width of span(L <sub>2</sub> ) | 8.86              | 10.6  |
| Width of column strip<br>(BS)  | 4.43              | 4.43  |
| Width of mid strip             | 4.43              | 6.17  |
| $L_2/L_1$                      | 0.836             | 1.20  |

They are generally employed for architectural reasons for large rooms such as auditoriums, vestibules, theatre halls, show rooms of shops where column free space is often the main requirement. The rectangular or square void formed in the ceiling is advantageously utilized for concealed architectural lighting. The sizes of the beams running in perpendicular directions are generally kept the same. Instead of rectangular beam grid, a diagonal.

#### ANALYSIS OF GRID SLAB

- 1) Approximate Methods
- 2) Analysis of grid Floor by Plate Theory

## 2. Design of flat slab with drop interior panel of size $10.6 \times 8.86 \mbox{ m}$

Size of columns =  $L_1/16$  or H/8=500mm Estimate size of column capital= D =  $L_2/5=1772$ 

Length of drop=1/3 span =  $3.5 \times 3.0 \text{ m}$ 

slab thickness=  $L_n = L_1$ -b=300 mm.

thickness of drop H=1.25 to 1.5 h=450mm

Size of external column =500 mm square

Size of edge beam=  $300 \times 600 \text{ mm}$ 

fck = 35;  $f_y = 415$ ;

Load Calculations:

- (a) Dead Load:  $bD\gamma = 1 \times 0.3 \times 25 = 7.5$  KN/m
- (b) Floor Finish = 1 kN/m
- (c) Live Load = 4 kN/m

Total Design Load = 18.75 KN/m

Dimensions:

Table 1

#### Analyze the Interior X frame:

 $M_0 = wL_2L_n^2 / 8 = 1618.34$  kNm

#### **DISTRIBUTION FACTORS:**

longitudinal distribution Inter span

Support (-ve) = 0.65, Span (+ve) = 0.35

End spans: Interior -ve = 0.75-0.1R = 0.69

Span +ve =.63-0.28R = 0.45; Exterior -ve = 0.65R= 0.42

Transverse distribution

Interior -ve : 75% to column strip;25% to mid

Span +ve : 60% to column strip;40% to mid-strip

Exterior -ve : 100% to column strip

Vol. 1, Issue 3, pp.837-848

Table 2

#### Check for shear:

Effective depth of slab = 270 mm,

Effective depth of slab = 270 mm,

Weight of drop projection below slab =  $25 \times (0.3 - 0.24) \times 1.5 = 2.25 \text{ kN/m}^2$ 

#### Design shear at critical section around capital

 $V_{ud} = 16.125(\ 10.6 \times 8.8\ 6 \ -(\ \pi \times (2.26\ ^2/4)) + 2.25\ (3.6 \times 3 \ -\pi \times (2.26\ ^2/4))$ 

= 1450.0 + 15.0 = 1936.5 KN. Design shear strength of concrete:

 $\begin{array}{ll} \tau c=k,\,\tau_c & \text{where, }\tau_c = 0.25 \sqrt{f_{ck}} \\ \tau_{c=} 0.25 \sqrt{35} \,\, = 1.48 \,\, \text{N/} \,\, \text{m}^2 \end{array}$ 

#### k =(0.5+ $\beta$ ) $\tau_c$ but $\leq 1.0$

 $\begin{array}{lll} k=1.0 & ; \ \tau_{uc} \ = \ 1.48 \ N/mm^2 & Shear \\ resistance of concrete & v_{uc} \ = \ \tau_{uc} \ \times \\ p \times d \ = \ 1.48 \times ( \ \pi \ \times 2260 \ ) \times 0.260 \ = 4723.42 \ KN \ > v \\ _{ud} \ (= \ 1936 \ ) & check \ for \ shear \ around \\ the \ drop: & The \ critical \ section \ is \ at \ a \\ distance \ d/2 \ = \ 270/2 \ = \ 135 \ mm \ from \ the \ periphery \ of \\ the \ drop \end{array}$ 

#### Design shear at critical section:

 $v_{ud} = 18.125 \{(10.6 \times 8.8 \ 6) - (3.6+0.20) \times (3.6+0.270)\} = 1480.4 \ KN.$ 

#### Shear resistance of concrete,

 $v_{uc} = 1.48 \times 2(3800+3800) \times (270/1000)$ 

= 6185 KN  $\,> v_{\,ud}$

Vol. 1, Issue 3, pp.837-848

#### 5. CONCLUSION :

1) Drops are important criteria in increasing the shear strength of the slab.

2) Enhance resistance to punching failure at the junction of concrete slab & column.3) By incorporating heads in slab, we are increasing rigidity of slab.

4) THE NEGATIVE MOMENT'S SECTION SHALL BE DESIGNED TO RESIST THE LARGER OF THE TWO INTERIOR NEGATIVE DESIGN MOMENTS FOR THE SPAN FRAMING INTO COMMON SUPPORTS.

5) Concrete required in Grid slab is more as compared to Flat slab with Drop and Flat slab without Drop.

6) Steel required in Flat slab without Drop is more as compared to Flat slab with Drop and Grid slab.

- 7) FLAT SLAB WITH DROP IS MORE ECONOMICAL THAN FLAT SLAB WITHOUT DROP AND GRID SLAB.
- 8) RATE PER SQUARE METER OF FLAT SLAB WITH DROP (3524) WAS FOUND TO BE MORE ECONOMICAL THAN FLAT SLAB WITHOUT DROP (3855) AND GRID SLAB (4005).
- 9) RATE PER SQUARE FEET OF FLAT SLAB WITH DROP (327) WAS FOUND TO BE MORE ECONOMICAL THAN FLAT SLAB WITHOUT DROP (358) AND GRID SLAB (372).
