# FT-IR and FT-Raman spectral analysis of 2-amino - 4,6dimethylpyrimidine 

R. Ramasamy and R. Ranjith kumar<br>Department of physics, National College (Autonomous) Trichy-620 001, Tamil Nadu, India

#### Abstract

Normal coordinate calculations of 2-amino-4,6-dimetylpyrimidine have been carried out using wilson's FG matix mechanism on the basis of General valence force field (GVFF) for both in-plane and out-of-plane vibrations. The potential energy constants obtained in this study are refined using numerical methods.

Key words: FT-IR, FT-Raman, 2-amino-4,6-dimethylpyrimidine, normal coordinate analysis, potential energy distribution.

## I. Introduction

A pyrimidine is a nucleotide (nucleoside + phosphate group) whose basic structure is cyclohexane with nitrogen atoms positioned at 1 and 3. This molecule is also aromatic and planar.

Pyrimidines have a long and distinguished history extending from the days of their discovery as important constituents of nucleic acids to their current use in the chemotherapy of AIDS.

During the last two decades, several pyrimidine derivatives have been developed as chemotherapeutic agents and have found wide clinical applications[1].
In the present paper, an effort has been made to record spectra and to assign the observed fundamental modes of vibrations. The evaluation of potential energy constant has been made on the basis of General Valence Force Field (GVFF) by applying wilson's FG matrix mechanism [2].

## II. Experimental Details

Pure chemical of 2-amino-4,6dimethylpyrimidine is obtained from Lancaster chemical company, England and used as such without any further purification.

The FT-IR spectrum of the title compound was recorded in the region $4000-400 \mathrm{~cm}^{-1}$ using KBr pellet. The Bruker IFS 66 V model FT-IR spectrometer was used for the spectral measurements. The globar and mercury arc sources, KBr beam splitters are used while recording FT-IR spectrum of the title compound.

The FT-Raman spectrum was recorded on a Bruker IFS 66V model interferrometer equipped with an FRA-106 FT-Raman accessory. The spectrum was recorded in the stokes region ( $4000-100 \mathrm{~cm}^{-1}$ ) using the 1064 nm line of a Nd:YAG laser for excitation operating at 200 mW of power.

## III. Results and Discussion

### 3.1. Structure and symmetry

The molecular structure of 2-amino-4,6dimethylpyrimidine is shown in Fig. 1. From the structural point of view the molecule is assumed to have $\mathrm{C}_{\mathrm{S}}$ point group symmetry. The 48 fundamental modes of vibrations arising for this molecule are distributed into $33 \mathrm{~A}^{\prime}$ and $15 \mathrm{~A}^{\prime \prime}$ species. The $\mathrm{A}^{\prime}$ and $A^{\prime \prime}$ species represent the in-plane and out-of-plane vibrations.

Fig 1 : Molecular structure of 2-amino-4,6dimethylpyridine

### 3.2. Normal coordinate Analysis

The evaluation of potential energy constants are made on the basis of GVFF by applying wilson's FG matrix mechanism. The structural parameters were taken from the sutton's table[3]. The vibrational
secular determinants have been solved using the computer programmes with the SIMPLEX optimization procedure[4]. The initial set of force constants and the vibrational frequencies required for the calculations were taken from the literature[5]. All the force constants have been refined via a non-linear square fit analysis between the calculated and observed frequencies. The refinement converged smoothly in three cycles.

### 3.3. Symmetry coordinates

Detailed description of vibrational modes can be given by means of normal coordinate analysis. For this purpose, the full set of 60 standard internal valence coordinates (containing 12 redundancies) were defined in Table 1. From these a non-redundant set of local internal coordinates were constructed (Table 2) much like the natural internal coordinates recommended by IUPAC [6,7]. Theoretically calculated force fields were transformed to the latter set of vibrational coordinates and used in all subsequent calculations.

Abbreviations used : ss - symmetric stretching; ass - antisymmetic stretching; ips- in-plane stretching; ops -out-of-plane stretching; sb-symmetic bending; ipb - in-plane bending; opb - out of-plane bending; ipr - inplane rocking; opr-out-of-plane rocking.

### 3.4.1. C-H vibrations

The molecular structure shows the presence of C-H stretching vibrations in the region $3000-3100 \mathrm{~cm}^{-}$ ${ }^{1}$, which is the characteristic region for the ready identification of C-H stretching vibrations [8]. In this region the bands are not affected appreciably by the nature of the substituents. Hence, in the present investigation, $\mathrm{C}-\mathrm{H}$ vibration has found at $3006 \mathrm{~cm}^{-1}$ in FT-IR.

### 3.4.2. C-C vibrations

The bands between 1400 and $1650 \mathrm{~cm}^{-1}$ in benzene derivatives are due to $\mathrm{C}-\mathrm{C}$ stretching vibrations [9]. Therefore, the C-C stretching vibrations of the title compound are observed at $1600,1568 \mathrm{~cm}^{-1}$ in IR and $1589,1440 \mathrm{~cm}^{-1}$ in Raman.

### 3.4.3. C-N vibrations

The identification of $\mathrm{C}-\mathrm{N}$ stretching frequency is very difficult task, since the mixing bands are possible in this region. Hence the FT-IR bands observed at $1395,1340 \mathrm{~cm}^{-1}$ in IR and 1423, 1389, $1348 \mathrm{~cm}^{-1}$ in Raman of the title compound are assigned to $\mathrm{C}-\mathrm{N}$ stretching modes of vibrations. These assignments are made in accordance with the assignments proposed by krishna kumar et al.[10].

### 3.4.4. Amino group vibrations

According to socrates [11] the frequencies of the amino group appear around $3500-3300 \mathrm{~cm}^{-1}$ for $\mathrm{NH}_{2}$ stretching, $1700-1600 \mathrm{~cm}^{-1}$ for scissoring and $1150-$ $900 \mathrm{~cm}^{-1}$ for rocking deformations. The antisymmetric
and symmetric stretching modes of $\mathrm{NH}_{2}$ group are found at $3312 \mathrm{~cm}^{-1}$ and $3191 \mathrm{~cm}^{-1}$ in IR for the title compound. The band appeared at $1628 \mathrm{~cm}^{-1}$ in infrared is assigned unambiguously to the scissoring mode of the $\mathrm{NH}_{2}$ group. The $\mathrm{NH}_{2}$ rocking mode has been assigned to $1032 \mathrm{~cm}^{-1}$ in IR. The Raman bands for wagging and twisting $\mathrm{NH}_{2}$ modes of the title compound are identified at $631 \mathrm{~cm}^{-1}$ and $345 \mathrm{~cm}^{-1}$ respectively.

### 3.4.5. Methyl Group vibrations

The methyl group substituted at the third position of the title compound give raise to asymmetric and symmetric stretching vibrations.

The $\mathrm{CH}_{3} \mathrm{ss}$ frequencies are established at $2930 \mathrm{~cm}^{-1}$ in IR, $2924 \mathrm{~cm}^{-1}$ in Raman and $\mathrm{CH}_{3}$ ips at $2980 \mathrm{~cm}^{-1}$ in IR, $2995 \mathrm{~cm}^{-1}$ in Raman for the title compound.

The two in-plane methyl hydrogen deformation modes are also well established. We have observed the symmetrical methyl deformation modes $\mathrm{CH}_{3} \mathrm{sb}$ at $1368 \mathrm{~cm}^{-1}$ in IR, $1359 \mathrm{~cm}^{-1}$ in Raman and in-plane bending methyl deformation modes $\mathrm{CH}_{3} \mathrm{ipb}$ at $1463 \mathrm{~cm}^{-1}$ in Raman, $1456 \mathrm{~cm}^{-1}$ in IR. The bands at $2767 \mathrm{~cm}^{-1}$ in Raman, $2740 \mathrm{~cm}^{-1}$ in IR and $1159 \mathrm{~cm}^{-1}$ in IR, $1149 \mathrm{~cm}^{-1}$ in Raman are attributed to $\mathrm{CH}_{3}$ ops and $\mathrm{CH}_{3} \mathrm{opb}$ respectively in the $\mathrm{A}^{\prime \prime}$ species. The methyl deformation modes mainly coupled with the in-plane bending vibrations.

The bands obtained at $995 \mathrm{~cm}^{-1}$ in Raman, $982 \mathrm{~cm}^{-1}$ in IR and $959 \mathrm{~cm}^{-1}$ in Raman, $950 \mathrm{~cm}^{-1}$ in IR are assigned to $\mathrm{CH}_{3}$ in-plane and out-of-plane
rocking modes. The assignments of the band 251 , $215 \mathrm{~cm}^{-1}$ in Raman are attributed to methyl twisting mode. These assignments are also supported by the literature[12].

## IV. Conclusion

Based on the normal coordinate analysis a complete vibrational analysis was performed for the title compound. A systematic set of symmetry coordinates have been constructed. The closer agreement obtained between the calculated and the observed frequencies and the PED calculations are also supporting the assignments made for various functional groups present in the molecule.
